Overview
The FTSE Target Exposure Factor Indexes provide investors with the ability to pursue a variety of explicit factor exposures, while reducing exposure to unwanted factors and controlling market, country and industry active bets. The indexes are part of the FTSE Global Factor Index Series and employ FTSE Russell’s well-established Tilt-Tilt methodology. The “bottom up” rules based methodology successively applies tilts to capture targeted exposures and applies corrective tilts to neutralize and/or minimize all off target exposures. The strength of each tilt is varied at each rebalance, to achieve specific exposure targets through time. Exposure outcomes are therefore flexible and may be combined to cater to specific investor objectives.

Features
• The indexes are designed to target specific levels of factor exposure in a rules-based and investable format
• The Tilt-Tilt methodology provides index factor exposure in a more controlled manner, while balancing concerns about liquidity, capacity, diversification and turnover
• Eligible securities of each factor index are the constituents of the relevant FTSE Russell index universe such as FTSE-All World Index or Russell 1000® Indexes, respectively
• The indexes are also customizable – any underlying universe can be used, and a range of different factor tilt combinations and other screens can be applied

Results
• Reduction of off-target exposure; a key cause of implementation shortfall
• Ability to set market beta country and industry neutrality
• Allows creation of ‘Pure’ single factor indexes with reduced exposure to off-target factors and to un-rewarded risk
• Multi-factor combinations can help mitigate investment cyclicality by diversifying across several factors
• Specific exposure magnitudes enable investors to form reasonable tracking error expectations
• Potential for improvement in risk adjusted index outcomes

Pure Single Factor Indexes*
• Russell 1000 Pure Value Target Exposure Factor Index
• Russell 1000 Pure Quality Target Exposure Factor Index
• Russell 1000 Pure Size Target Exposure Factor Index
• Russell 1000 Pure Momentum Target Exposure Factor Index
• Russell 1000 Pure Low Volatility Target Exposure Factor Index

Multi-Factor Indexes*
• FTSE All-World Target Exposure Qual/Vol Factor Index
• FTSE All-World Comprehensive Target Exposure Factor Index
• FTSE All-World Comprehensive High Target Exposure Factor
• FTSE Developed Comprehensive Target Exposure Factor Index
• FTSE Developed Comprehensive High Target Exposure Factor Index
• Russell 1000 Comprehensive Target Exposure Factor Index
• Russell 1000 Comprehensive High Target Exposure Factor Index

The factors

A factor is a stock characteristic that is important in explaining a security’s risk and return. The FTSE Target Exposure Factor Indexes reference five equity factors, each of which is supported by academic research, with strong theoretical explanations as to why the factor historically has provided a premium.

- Factor-based investing is premised on the ability to identify factors that are expected to earn a positive premium in the future (i.e. factor exposures which are compensated)
- Factors tend to exhibit low correlation with one another, which means they may perform differently in different parts of the market cycle
- FTSE Russell’s factors represent common factor characteristics supported by a body of empirical evidence across different geographies and time periods

Factor premia and definitions

<table>

</table>
| QUALITY  | **The Quality Premium:** Higher quality companies tend to demonstrate higher performance than lower quality companies.  
**Quality tilts:** Can help capture companies with the ability to consistently generate strong future cash flows, while limiting exposures to stocks that are unprofitable or highly leveraged. | Composite of profitability, efficiency, earnings quality and leverage         |
| SIZE     |                                                                             |                                                                           |
| VALUE    |                                                                             |                                                                           |
| MOMENTUM |                                                                             |                                                                           |
| VOLATILITY |                                                                         |                                                                           |
| QUALITY  | **The Size Premium:** Smaller companies tend to demonstrate higher performance than larger companies.  
**Size tilts:** Can help capture excess returns of smaller companies relative to their larger counterparts. | Log of full market cap.                                                   |
| SIZE     |                                                                             |                                                                           |
| VALUE    |                                                                             |                                                                           |
| MOMENTUM |                                                                             |                                                                           |
| VOLATILITY |                                                                         |                                                                           |
| QUALITY  | **The Value Premium:** Stocks that appear cheap tend to perform better than stocks that appear expensive.  
**Value tilts:** Can help capture exposures at a reasonable price relative to their fundamentals. | Composite of cash flow, earnings and country relative Sales: Price Ratio.   |
| SIZE     |                                                                             |                                                                           |
| VALUE    |                                                                             |                                                                           |
| MOMENTUM |                                                                             |                                                                           |
| VOLATILITY |                                                                         |                                                                           |
| QUALITY  | **The Momentum Premium:** Stock performance tends to persist, either continuing to rise or fall.  
**Momentum tilts:** Can lead to the selection of companies with strong recent performance, with the expectation that this will continue to produce short term excess returns in the future. | Cumulative 11 month return.                                               |
| SIZE     |                                                                             |                                                                           |
| VALUE    |                                                                             |                                                                           |
| MOMENTUM |                                                                             |                                                                           |
| VOLATILITY |                                                                         |                                                                           |
| QUALITY  | **The Low Volatility Premium:** Stocks that exhibit low volatility tend to perform better than stocks with higher volatility.  
**Low volatility tilts:** Can help capture companies with a historically lower risk (and higher return) profile relative to higher risk counterparts. | Standard deviation of 5 years of weekly local total returns.           |
| SIZE     |                                                                             |                                                                           |
| VALUE    |                                                                             |                                                                           |
| MOMENTUM |                                                                             |                                                                           |
| VOLATILITY |                                                                         |                                                                           |
Target Exposure Factor Index construction process

Step 1

Calculate Z-Scores and S-Scores

• Assign a ‘raw’ value to a given characteristic for each stock in the underlying index
• Normalize and truncate outliers to get Z-scores
• Z-scores are then mapped to S-scores using the exponential function:

\[ S_{Val} = \exp(Z_{Val}) \]

Step 2

Weights – The Multiple Tilt

• The general expression for weights is given by:

\[ W_T = W_{Mcap} \times S_{Val}^n \times S_{Mom}^{p} \times S_{Res}^{q} \times \cdots \times S_{Em}^{r} \times S_{Beta}^{s} \times S_{Country}^{t} \times S_{Industry}^{u} \]

• Where \( W_r \) are the weights in the final index, \( W_{Mcap} \) are market capitalization weights and \( n, \ldots, u \) are the strengths of the tilts
• Weights are normalized to add up to 1

Step 3

Specify Targeted Objectives

• Factor objectives are given as a set of Exposure Targets which are measured in Z-Score units, that is units of cross-sectional standard deviation of the factor characteristics
• Country and industry objectives are stated as a targeted set of active weights that satisfy upper and lower bounds
• Beta, capacity, turnover, maximum stock weight objectives may also be set
• Incorporate ESG objectives if part of strategy

Step 4

Find the Tilt Strengths in Step 2 that satisfy the Targets set in Step 3

• This is done by solving a set of simultaneous equations for the tilt strengths (one for each targeted quantity)
• Relaxation rules are applied when a solution cannot be found or when the proposed set of weights drop below a given degree of diversification

Step 5

Final Weights

• The factor tilt strengths \( n, \ldots, u \) vary from rebalance to rebalance
• The resulting weights will satisfy all targeted objectives simultaneously
**Target Exposure Factor implementation examples**

- Allows precise factor control at rebalance
- Avoids unintentional factor exposures that lead to Implementation Risk
- Can incorporate other factor exposure characteristics such as:
  - Beta neutrality
  - Industry neutrality
  - Country neutrality
  - Carbon Reduction
  - ESG Uplift

About FTSE Russell

FTSE Russell is a leading global index provider creating and managing a wide range of indexes, data and analytic solutions to meet client needs across asset classes, style and strategies. Covering 98% of the investable market, FTSE Russell indexes offer a true picture of global markets, combined with the specialist knowledge gained from developing local benchmarks around the world.

FTSE Russell index expertise and products are used extensively by institutional and retail investors globally. For over 30 years, leading asset owners, asset managers, ETF providers and investment banks have chosen FTSE Russell indexes to benchmark their investment performance and create investment funds, ETFs, structured products and index-based derivatives. FTSE Russell indexes also provide clients with tools for asset allocation, investment strategy analysis and risk management.

A core set of universal principles guides FTSE Russell index design and management: a transparent rules-based methodology is informed by independent committees of leading market participants. FTSE Russell is focused on index innovation and customer partnership applying the highest industry standards and embracing the IOSCO Principles. FTSE Russell is wholly owned by London Stock Exchange Group.
